Buzzword to Necessity

5G Latency IoT
IIoT uDC Edge
Smart
Industry 4.0 Cloud

We use them, but do we really know what they mean?

Many people have their own idea of what an Edge DC is

Who is right and who is wrong?

How do we actually define it?

Can we actually define it?

What drives the need for the edge?

*“Not everything that counts can be counted, and not everything that can be counted counts.”
- Albert Einstein*

“SOON, everything that counts WILL be ABLE TO BE counted, and everything that can be counted WILL EVENTUALLY count.”

25-50 Billion Connected Devices by 2022

Collecting and communicating lots of data

**Store, Process,
Forward,
React?**

What do we do with it?

What do we do with the data?

 This is almost full

Sends a signal to
“schedule” a service

Low Response

This is almost empty

Notifies you that Fido’s bowl
will soon need attention

Moderate Response

This is full

Sends a message to your device in
real time signaling need for
immediate attention.

Immediate Response

Do they require different response times?

What do we do with the data?

Do they require different response times?

Definitions of Latency

- The time required online or in a network for the one-way or round-trip transfer of data between two nodes. *(dictionary.com)*
- The time it takes for data to travel from one user, over the network to the central processor and back again. *(verizonwireless.com)*

We all want the lowest latency, but is it **needed**, practical, or affordable?

Interesting related latency definition

- In virtual reality and other types of simulation, the discrepancy between the time delay of stimulus and response in the simulation as compared to the real-world equivalent. *(dictionary.com)*

Where is low latency “needed?”

Life Safety / Health Monitoring

At work

At rest

At play

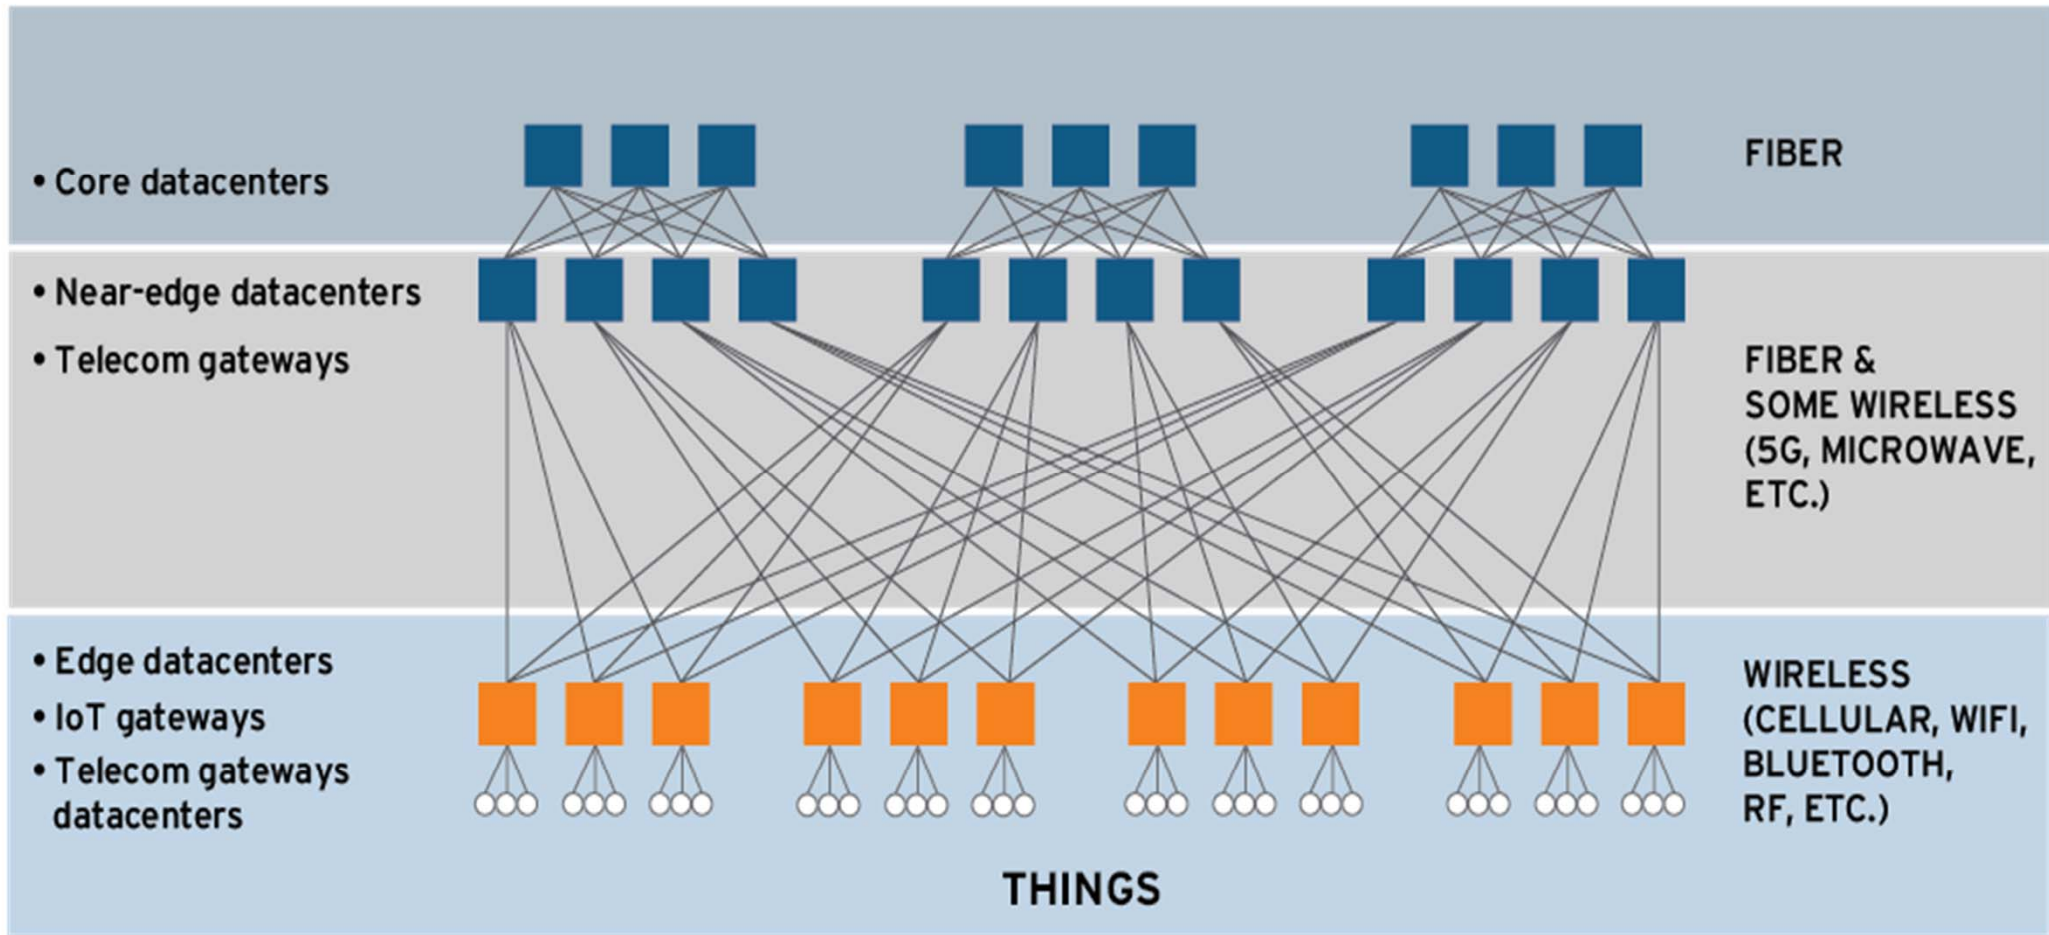

Predictive Machine Failure

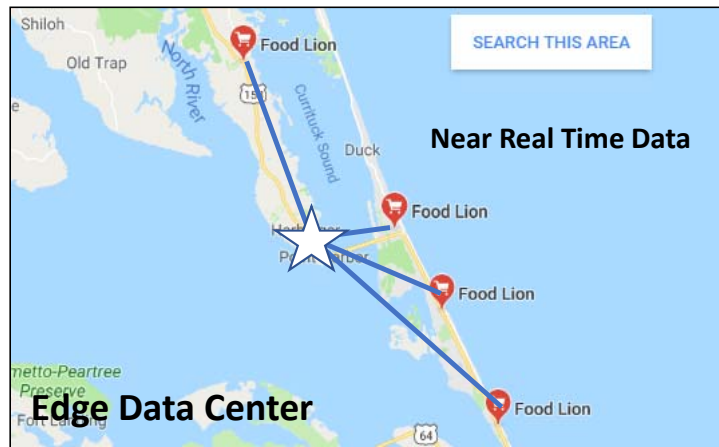

Autonomous Vehicles

Architectures, types, functions

Process proximity to user or data

Where to find Edge Data Centers

As the number of devices increase, and latency requirements become more critical, costs and reliability of transporting and processing data will become areas of more concern and force the edge to locations almost unimaginable today.

“The Edge of the Edge...”

What they look like

A dedicated data center or a functional area within

A micro data center within a building or tower shack

Mobile/Temporary

In the neighborhood

In the house

On our person

TODAY

TOMMORROW

BEYOND

Edge data centers are defined more from their function of being close to the data source than appearance or physical location. In the future, what we consider an edge may be much different than we imagine today.

Hiding in plain sight

As these data centers migrate closer to the device, they may become smaller and be located in non-Telecom type spaces. This may require them to be more self contained and function a little different.

And probably “Un-manned” Remote Monitoring

Definition of an Edge Data Center

Definition (Almost) Found – *A constantly evolving, size independent space, containing switch, storage, and compute equipment, located geographically close enough to meet response and latency requirements of the application(s), while balancing cost and reliability to achieve expected results.*

Only time will tell what an Edge Data Center will look like and how we will define it in the future. For now, we can only speculate that it will be “sort of greenish, but with more dimensions” while adhering to the principles mentioned in the definition above.

Thank you!
